

# An application of a pollution index and multicriteria decision tool in quantifying the hazards of historic mine sites for their repurposing

ZM Dzegere, I Watson, SE Mhlongo

***ESG in the Minerals Industry Challenges and Opportunities***  
***16-17 October 2024***

**SAIMM**  
THE SOUTHERN AFRICAN INSTITUTE  
OF MINING AND METALLURGY

# Introduction

- ❖ Abandoned mines in South Africa.
- ❖ Negative impacts.
- ❖ Potential for other uses.
- ❖ Clear objectives for rehabilitation.

# Objective

- ❖ To identify and quantify hazards of a selected study area
- ❖ Effectiveness of the methods

# Study Site

- ❖ Found at Ka Mapuve Village in Limpopo.
- ❖ A gold mine characterized by deep excavations.
- ❖ 23°17'20\"S; 30° 34'9\" E

Figure 1 Locality map of Franke mine

# Study Approach

# Soil pollution ranking using pollution indices

- ❖ Contamination factor for each heavy metal

$$Cf = \frac{C}{P}$$

- ❖ Pollution load index

$$PLI = (Cf1 \times Cf2 \dots Cf_n)^{(1/n)}$$

- ❖ Modified degree of contamination

$$mCd = \frac{Cd}{n}$$

# Physical hazards ranking using AHP and TOPSIS

- Super decision software (AHP)

- Online-output (TOPSIS)

## **RESULTS AND DISCUSSION**

# Contamination factor

| ID  | Pb     | Ni    | Co    | Cd    | As     | Zn    | Cu     | Cr     |
|-----|--------|-------|-------|-------|--------|-------|--------|--------|
| fS1 | 0,875  | 280   | 0,129 | 1,666 | 1,777  | 0,45  | 65,265 | 924    |
| fS2 | 0,533  | 3,344 | 0,328 | 0,666 | 9,195  | 0,39  | 8,604  | 8,072  |
| fS3 | 0,733  | 2,564 | 0,016 | 0,666 | 3,160  | 0,532 | 11,00  | 9,652  |
| fS4 | 0,833  | 1,930 | 0,016 | 0,667 | 5,632  | 0,363 | 5,290  | 5,971  |
| FS5 | 0,800  | 2,945 | 0,016 | 0,667 | 5,229  | 0,392 | 5,290  | 12,101 |
| FS6 | 0,417  | 2,703 | 0,016 | 0,667 | 5,287  | 0,167 | 3,479  | 20,080 |
| FS7 | 15,133 | 4,611 | 0,016 | 0,667 | 11,379 | 0,275 | 3,196  | 20,072 |
| FS8 | 9,850  | 4,513 | 0,016 | 0,449 | 11,839 | 0,286 | 4,208  | 19,123 |

- ❖  $1 < CF < 3$  moderate
- ❖  $3 < CF < 6$  high
- ❖  $CF > 6$  very high

# Pollution Level of a site per point (PLI)

- ❖ Pollution  $>1$  mean the site is contaminated.
- ❖ The site is contaminated ( low level of contamination – high level contamination ).

# Pollution Level ( MCD)

- ❖ All the sampling points suggests moderate to extremely high contamination.

# Physical features

# Ranking of physical hazards using AHP

❖ Results after synthesizing the model.

| Features                              | Ideals   | Normals  | Raw      |
|---------------------------------------|----------|----------|----------|
| Dilapidated buildings                 | 0.839837 | 0.201190 | 0.201190 |
| Ground cracking and sinkholes         | 0.682610 | 0.163525 | 0.163525 |
| Mine wastes                           | 0.682610 | 0.163525 | 0.163525 |
| Old mining equipment                  | 0.344113 | 0.082435 | 0.082435 |
| Open mine entries                     | 0.625177 | 0.149766 | 0.149767 |
| Pits and excavation filled with water | 1.000000 | 0.239558 | 0.239559 |

# Ranking of physical hazards using AHP

- ❖ pits and excavation filled with water is ranked number 1 hazard.

# Closeness to the ideal solution

| Features                                   | Distance to ideal solution | Distance to ideal negative solution |
|--------------------------------------------|----------------------------|-------------------------------------|
| dilapidated building                       | 0,109                      | 0,101                               |
| ground cracking and sinkhole               | 0,112                      | 0,093                               |
| mine waste                                 | 0,112                      | 0,093                               |
| old mining equipment                       | 0,145                      | 0,019                               |
| mine entries                               | 0,118                      | 0,091                               |
| mine pits and excavation filled with water | 0,025                      | 0,144                               |

# Ranking of the hazards using Topsis

- ❖ Based on the ideal positive solution mine pits and excavation were still ranked number one.
- ❖ Although they use different algorithms , if the parameters are not changed the results are likely to remain the same.

# Conclusion

- ❖ For accuracy and best judgement, it is crucial to use two different approaches.
- ❖ Difference in contamination factor for each metal per point has to be taken into consideration when repurposing.
- ❖ Both Topsis and AHP can be applied in quantifying problems of abandoned mines.

# THANK YOU!
