BACKGROUND

The South African minerals industry finds itself at a crossroad where current levels of productivity and safety, which are driven by current mining and processing methods, will no longer be either socially or economically acceptable.

The future competitiveness of the Southern African minerals industry depends on the application of appropriate and workable technologies, as well as innovative mining and processing methods, that improve safety and productivity. These will be based on process based organisations that are enabled and empowered by increasing levels of real time data and information integrated across the value chain.

This event is aimed at presenting examples of how technology can improve the costs and competitiveness of the SA minerals industry, within the next 10 years and technology that is in use now. Not only will it draw on case studies and examples of technology development, but it will also explore innovative ways of applying state of the art technologies from other sectors, to the mining environment.

OBJECTIVES

To showcase, explain and demonstrate the potential for operational improvement through innovative but practical technological solutions aimed at improvements in quality, output and productivity.

It is also aimed at achieving a common vision of 'the art of the possible' as well as exploring new paradigms for mining and metallurgy in the future.
